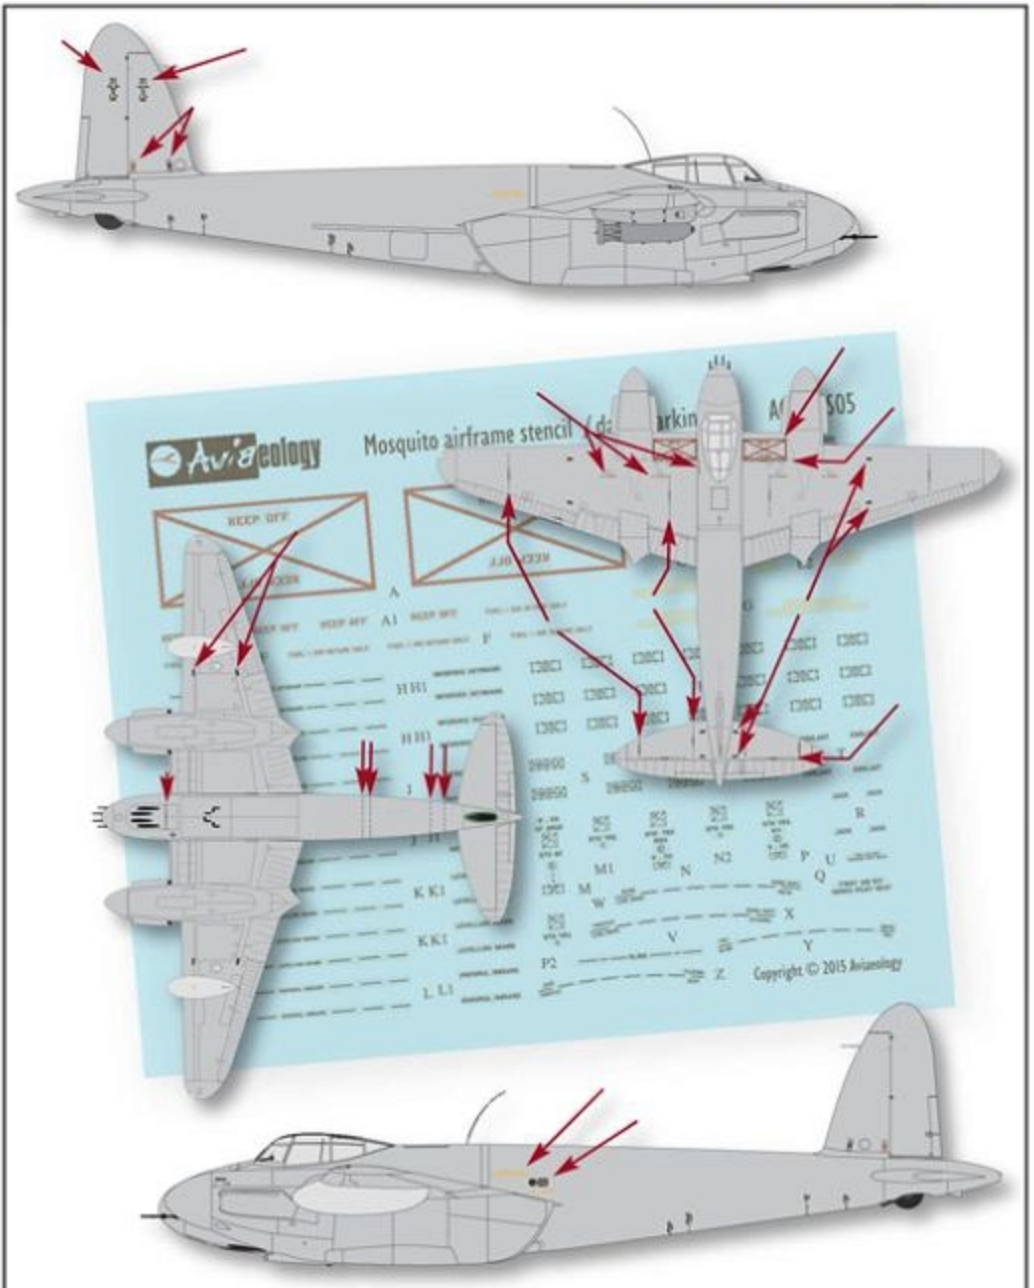
Aviaeology Airframe Stencil / Data series

AOD48S05

Mosquito (part 1) All marks



This package contains an extensive selection of airframe maintenance / data markings, including a number of factory and field-applied variations that have been observed for some of the individual elements. This set is compatible with all Mosquito finish schemes except the early-war overall Night (Matte Black) nightfighter scheme. Includes enough to complete at least one 1/48 scale model, and detailed application instructions.

1/48 scale

Mosquito airframe stencil / data markings

NOTE: *Where variations in markings styles have been found during research, alternates are provided in this set. Alternates have the same callout letter, but are suffixed with a number. The first callout is the preferred choice (seen most often in reference photos) while the second may have been seen less frequently in reference photos. Also note that some items may not have been applied (or reapplied after maintenance, etc) at all times. As always, consult available reference materials.*

Wing tanks were usually Aluminum Dope (a dull aluminum) as supplied. Some squadrons may have refinished in current camouflage colours.

In some squadrons, care was apparently taken to not overpaint some factory-applied stencil markings on some FB.VIs refinished by the Service in the early Intruder scheme with Night (Matte Black) undersides. However, later on (after early June 1944), these same markings were often obscured by the temporary AEAF stripes on many aircraft types, including Mosquitoes.

In either case, a check of reference photos of the aircraft being modelled is recommended.
