The best way to apply your Kagero Decals

Apply a clear gloss coat to the model. Make sure that the surface to be decaled is clean and dust free. Separate each individual marking from the decal sheet as needed. Remember to wet area where decal is to be applied with a decal wetting agent (SET) just before the application.

2

Submerge the decal in warm water for about 15 seconds. Then carefully take it out of water and remove the excess water from the decal using a paper towel. It is suggested that you soak one decal at a time.

3

When the decal will start to slide on the backing paper, hold the backing paper using a pair of tweezers and slide the decal onto the model. You still can properly position the decal using a wet soft brush.

4

Remove the excess water and wetting agent from the decal using a paper towel and an ear swab simultaneously.

Apply a decal solvent (SOL) with a brush after next 10-15 minutes which will help the decal conform to any irregularities on the model surface.
